

Claims

1. Method for transmission of data in an IP packet network, which comprises a cluster of cluster units, a switching unit having a plurality of ports, the cluster units being connected to a part of the plurality of ports, which cluster units share a unicast IP address, said method comprising at least steps, in which
- the cluster units are configured to be members of an IP multicast group specific to the cluster,
 - the IGMP protocol is used to obtain information about to which ports of the plurality of ports the cluster units are connected,
 - the MAC address of a received IP packet is checked, and if said MAC address is a multicast MAC address, the IP destination address of said packet is compared to the unicast IP address shared by the cluster units,
 - if the IP destination address of said packet is the same as the unicast IP address, the packet is forwarded to those ports, to which the cluster units were found to be connected.
2. The method of claim 1, further comprising at least steps, in which the switching unit receives an IGMP group membership report, the switching unit checks, if said report is addressed to said IP multicast group specific to the cluster, and if it is, the switching unit stores into its memory the identifier of the port, through which said report arrived.
3. The method of claim 1, further comprising a step, in which an IGMP group membership query is sent by the switching unit.
4. The method of claim 1, wherein the IGMP protocol is protocol version 1 according to RFC 1112.
5. The method of claim 1, wherein the IGMP protocol is protocol version 2 according to RFC 2236.

- 5 - means for observing using the IGMP protocol which ports of the switching unit are connected to the cluster units,
- means in the switching unit for observing the MAC destination address of a packet arriving to the switching unit and for checking if said MAC destination address is a MAC multicast address,
- 10 - means in the switching unit for observing the IP destination address of said packet and for comparing said IP destination address to said IP unicast address associated with the cluster units,
- means in the switching unit for forwarding of the packet to those ports whose identifiers were previously stored to said memory means as a response to the finding
- 15 that said IP destination address and said IP unicast address are the same and said MAC destination address is a MAC multicast address.

20 - means in the switching unit for observing IGMP multicast group reports and for checking, if a received IGMP multicast group report is addressed to said IP multicast group specific to the cluster system, and

- means in the switching unit for storing into a memory means an identifier of that port via which said received IGMP multicast group report arrived as a response to

25 finding that said report was addressed to said IP multicast group.

30 9. The system according to claim 6, wherein the cluster units are gateway units.

10. The system according to claim 6, wherein the cluster units are server units.
